Using Gamified Tumor Boards to accelerate Cancer Research

RareKidneyCancer.org

W.G. Paseman
bill@RareKidneyCancer.org

20240416

Agenda

- ***Who am I? - EHR**
- **Ad hoc tumor boards aided me in my Medical Decisions**
  - Evaluating an adjuvant clinical trial: Participate or not?
  - Evaluating radiation therapy: Proton or Photon?
- **Hackathons formalize and scale the tumor board process**
  - Focusing 17 Gamified Tumor Boards on one rare disease patient advanced Research
- **Hackathons can be fully automated**
  - Replacing Patients and Tumor Board members with LLMs (Large Language Models).

Who am I? - EHR

- 201311 – Diagnosed DVT – Put on Warfarin
- 201402 – Diagnosed second DVT (while on Warfarin)
  - JHH - Diagnosed with Kidney Cancer and Brain Tumor (1x1.2x0.8 cm)
- 201403 – Total left Nephrectomy

https://thepatientstory.com/patient-stories/kidney-cancer/bill-p/

Agenda

- **Who am I? - EHR**
- ***Ad hoc tumor boards aided me in my Medical Decisions**
  - Evaluating an adjuvant clinical trial: Participate or not?
  - Evaluating radiation therapy: Proton or Photon?
- **Hackathons formalize and scale the tumor board process**
  - Focusing 17 Gamified Tumor Boards on one rare disease patient advanced Research
- **Hackathons can be fully automated**
  - Replacing Patients and Tumor Board members with LLMs (Large Language Models).

Decision 0: Surgeon & Procedure

- My brother in law is a Gastroenterologist.
  - If I died on the table, I figured he'd have to deal with his sister for the rest of her life, so I trusted him.
  - He recommended Max Meng. I'm still NED.
- I opted for a full left Nephrectomy.
  - "Cut it all out".
- "80% chance it is clear cell RCC."
  - Pathology indicated papillary Renal Cell Carcinoma
    - (Rare Disease => No Standard of Care)
- 201602 – NIH Pathology indicates p1RCC
  - indolent – So I have time

Decision 1: Adjuvant Trial

- EVEREST (adjuvant) Clinical Trial using Everolimus
  - “Everolimus versus sunitinib for patients with metastatic non-clear cell renal cell carcinoma (ASPEN): a multicentre, open-label, randomised phase 2 trial”**
  - I asked 13 physicians if I ought participate
    - Yes: 3
    - No: 5
    - Patient must decide: 5
  - Key Opinion: “I do not recommend any adjuvant trial w/ mTOR inhibitors or VEGF targeted agents for papillary RCC. There will be trials with immune checkpoint agents in the near future, but not soon enough to enroll on.”
    - **i.e. “We tried this out as a first line therapy, and it didn’t even slow it down.**
- 201406 – I declined
- **Process**
  - **not “consensus”**
  - **Looked until someone explained it in a way I found helpful.**

** https://pubmed.ncbi.nlm.nih.gov/26794930/

Decision 2: Proton vs Photon

- 202303 – Meningioma hits limits (1.8 x 1.6 x 1.5 cm - 2.51 cc) for Radiation
  - Photon – (e.g. Gamma knife) 100's of beams completely traverse Brain
  - Proton – Stops Dead in Tumor BUT one study shows more damage?
    - "Radiation-induced brain injury in patients with meningioma treated with proton or photon therapy" - https://doi.org/10.1007/s11060-021-03758-y
- I asked 14 physicians which procedure I ought use
  - Guys with photon machines said use photon
  - Guys with proton machines said use proton
  - One with both said use photon
  - One said "Ask about the mechanic, not the tools"
- 202303 I did Photon (Gamma Knife) at UCSF
- 202309 - 1.8 x 1.5 x 1.6 cm – 2.43 cc
  - No growth (but thyroid is growing)
- **Process**
  - **not "consensus"**
  - **Looked until someone explained it in a way I found helpful.**

Agenda

- **Who am I? - EHR**
- **Ad hoc tumor boards aided me in my Medical Decisions**
  - Evaluating an adjuvant clinical trial: Participate or not?
  - Evaluating radiation therapy: Proton or Photon?
- ***Hackathons formalize and scale the tumor board process**
  - Focusing 17 Gamified Tumor Boards on one rare disease patient advanced Research.
- **Hackathons can be fully automated**
  - Replacing Patients and Tumor Board members with LLMs (Large Language Models).

Linking Binary Gene Relationships to Drivers of Renal Cell Carcinoma Reveals Convergent Function in Alternate Tumor Progression Paths

William L. Poehlman[1], James J. Hsieh[2] & F. Alex Feltus[1]

Renal cell carcinoma (RCC) subtypes are characterized by distinct molecular profiles. Using RNA expression profiles from 1,009 RCC samples, we constructed a condition-annotated gene coexpression network (GCN). The RCC GCN contains binary gene coexpression relationships (edges) specific to conditions including RCC subtype and tumor stage. As an application of this resource, we discovered RCC GCN edges and modules that were associated with genetic lesions in known RCC driver genes, including VHL, a common initiating clear cell RCC (ccRCC) genetic lesion, and PBRM1 and BAP1 which are early genetic lesions in the Braided Cancer River Model (BCRM). Since ccRCC tumors with PBRM1 mutations respond to targeted therapy differently than tumors with BAP1 mutations, we focused on ccRCC-specific edges associated with tumors that exhibit alternate mutation profiles: VHL-PBRM1 or VHL-BAP1. We found specific blends molecular functions associated with these two mutation paths. Despite these mutation-associated edges having unique genes, they were enriched for the same immunological functions suggesting a convergent functional role for alternate gene sets consistent with the BCRM. The condition annotated RCC GCN described herein is a novel data mining resource for the assignment of polygenic biomarkers and their relationships to RCC tumors with specific molecular and mutational profiles.

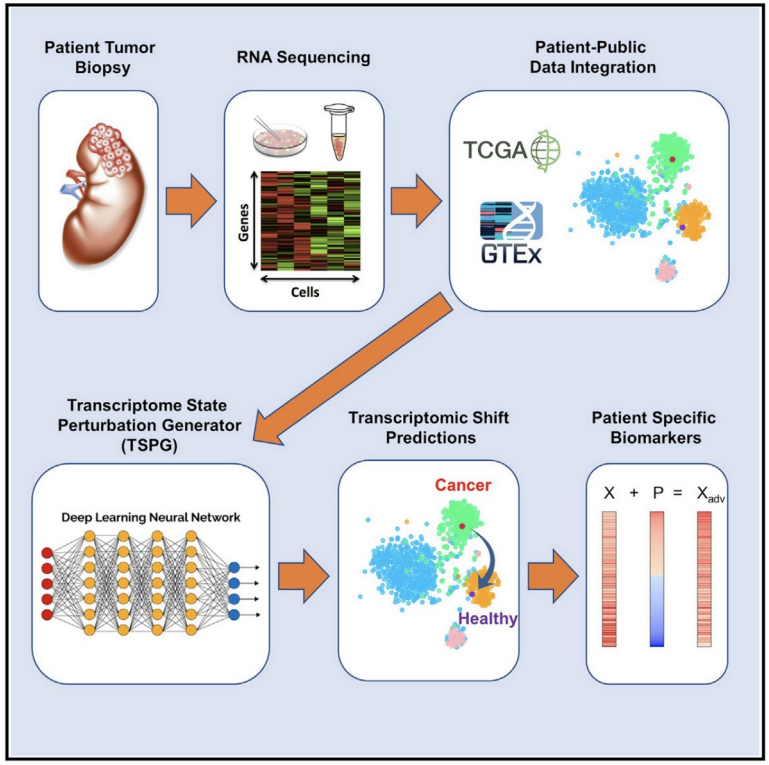
Cellular State Transformations Using Deep Learning for Precision Medicine Applications

Graphical Abstract



Highlights

- We present the Transcriptome State Perturbation Generator (TSPG) application

In Brief

Cells express genes in unique combinations that enable distinct functions. Using machine learning, we present an algorithm that takes a source gene expression snapshot and learns how to change it to mimic a target snapshot. We applied the Transcriptome State Perturbation Generator algorithm to learn which genes have changed in a single patient's tumor relative to a normal tissue sample. By knowing which gene expression changes are required to leave a normal state in a single person, it is possible to design therapeutic strategies tailored for that patient.

Biomarkers.ai - 2018

- KNG1 uses alternative splicing to generate two different proteins: High MWt kininogen (HMWK) and MWt kininogen (LMWK). HMWK is essential for blood coagulation and assembly of the kallikrein-kinin system. This might explain my medical history.
  - Got warfarin/coumadin for diagnosis of deep vein thrombosis
  - DVT Symptoms returned. Went back and found: 7 cm mass left kidney, cerebral meningioma and spots in lung.
- Uromodulin (encoded by UMOD; also known as Tamm-Horsfall protein) is the most abundant protein in mammalian urine under normal physiological conditions.
  - UMOD can distinguish Normal Tissue from p1RCC with 100% accuracy.
  - Is UMOD also a good urine-based biomarker for p1RCC?
- FHL1 was an indicator for petrochemical exposure. For a time I worked in chemical refineries and on oil rigs. This might be the source of my somatic mutation.
  - Exposure to benzopyrene and several other agents enhances FHL1 expression

Why did BIOada.com do better?

- Saed Sayad came to the hackathon with a set of favorite tools already in place (BIOada.com) which saved analysis time.
- He created a normalized cohort by looking up RNA data on NCBI GEO (Gene Expression) data) using my DNA data as a key. RNA provided a stronger signal than my DNA data, and ultimately matched my RNA-seq data when it became available.
- This stronger signal allowed him to use a simpler data analysis technique (LDA- Linear Discriminant analysis) to get clean data separation and so make better predictions.
- His team was small and focused. Note that a 2019 article entitled "Can Big Science Be Too Big?" posited that papers with few authors tended to report more breakthrough research and papers with many authors tended to confirm existing findings.
- His outsized results are supported by portfolio theory. Dr. Sayad took on a lot of risk (Using one tool, BIOada.com. Abandoning DNA data, using GEO instead. Using one method, LDA. Using a small team, generating fewer new ideas) and so was likely to either get a big win, or go bust.
- In that sense, a hackathon can be viewed as a portfolio of real options, and a hackathon "portfolio" has similar risk/return math to that used in financial portfolio construction.

Patient Centered Game Elements Ensemble Learning

“Patient Centered”

- Patients view themselves as having a “rare disease” that is not served well by cohort analysis. We hope to use sibling and parent genetic data as a "control" in future events.
- Patients themselves host and maintain control of the event and are responsible for providing their own data.
- Data Control allows patients to create a current, longitudinal record over time for each subsequent hackathon as their disease develops.

“Game Elements”

- Hackathon participants are divided up into teams.
- The Game has “levels” which include diagnosis and therapeutic recommendations.
- Team’s results are “scored” which helps the Patient prioritize future research approaches.
- Scores can be posted on a LeaderBoard, which allows sharing of Research Approaches.

“Treat Research Teams as formal computational objects”

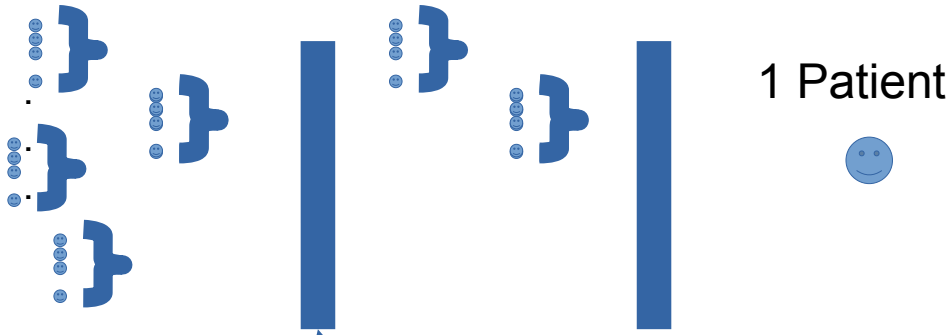
- Apply an “Ensemble Learning” technique called "bucket of models".
- For each model m in the bucket:
- Do c times: (where 'c' is some constant)
- Randomly divide the training dataset into two datasets: A, and B.
- Train m with A; Test m with B
- Select the model that obtains the highest average score

Agenda

- **Who am I? - EHR**
- **Ad hoc tumor boards aided me in my Medical Decisions**
  - Evaluating an adjuvant clinical trial: Participate or not?
  - Evaluating radiation therapy: Proton or Photon?
- **Hackathons formalize and scale the tumor board process**
  - Focusing 17 Gamified Tumor Boards on one rare disease patient advanced Research
- *__Hackathons can be fully automated__
  - Replacing Patients and Tumor Board members with LLMs (Large Language Models).

Next Gen approaches to automate data sharing and research

Now: Competition (**Gamification**)



- Ensemble Reasoning
  - "The best way to have a good idea is to have lots of ideas." - Linus Pauling

Next: Automation

- Process – Basically, Hackathons are multi-armed clinical trials for research processes.
  - Scale Hackathons up and make them faster.
  - Automate creation of Hackathon variants.
- Researcher(s) → LLM Agent team members
  - Chatbot → ResearchBot
- Patient(s) → LLM Agent Digital Twins
  - HIPAA – Not an issue for me
    - Need to do better later
  - EHR → DigitalTwin
    - Need to Represent Time Well
    - Integrate Genomics/Radiology later
    - Diagnosis vs hallucinations
- Data → Genomic GANS for rare diseases

Summary

- I am not interested in cancer researchers' tools.
  - They can use their tools better than I.
- I am not interested developing new tools for cancer researchers.
  - There are better tool developers than I.
- I am interested in "Improving how Cancer Research Improves"
- I believe that Innovative use of Tumor Boards is one way to get faster improvement.
- **Contact me if you're interested in participating in future hackathons, or if you want to get involved in improving the hackathon process (LLMs are the current focus)**
  - bill@rarekidneycancer.org

Final Word

An obvious point needs to be made explicitly here. Though I contributed data on the front end of the process and did a few SQL table joins and sorts on the back end of the process, NONE of the biology is my work. It is the work of the many volunteer researchers who spent many hours exploring my data on my behalf. Thank You.

"If you work on frequent cancers, do randomized trials! If you work on rare cancers—find friends!"Olson, TA, Schneider, DT, Brecht, IB, et al. Rare tumors: a different perspective on oncology. In: Schneider, DT, Brecht, IB, Olson, TA, Ferrari, A, eds. Rare Tumors in Children and Adolescents. Berlin: Springer; 2012: 3–15.
